

# ***Towards hybrid microfluidic solutions for real-time silica detection in underground coal mines***

Silica Exposure and Lung Disease in the Mining Industry Workshop

**10/23/2020**

**Igor Paprotny**  
**University of Illinois at Chicago**

# Air-Microfluidics Group (AMFG)

## Access to facilities at four (UIC/UCB/ANL) campuses

Marvel Nanofabrication Laboratory, UCB

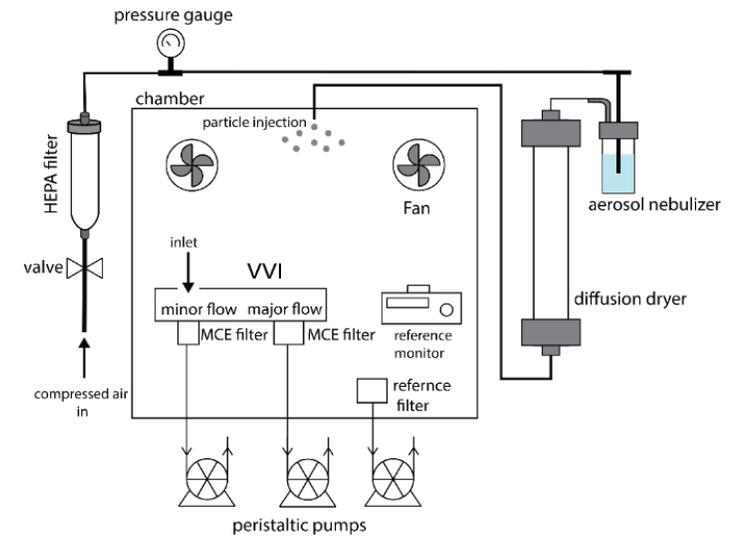

Nanofabrication Central Facility, UIC

Center for Nanoscale Materials, ANL

Paprotny Lab, UIC

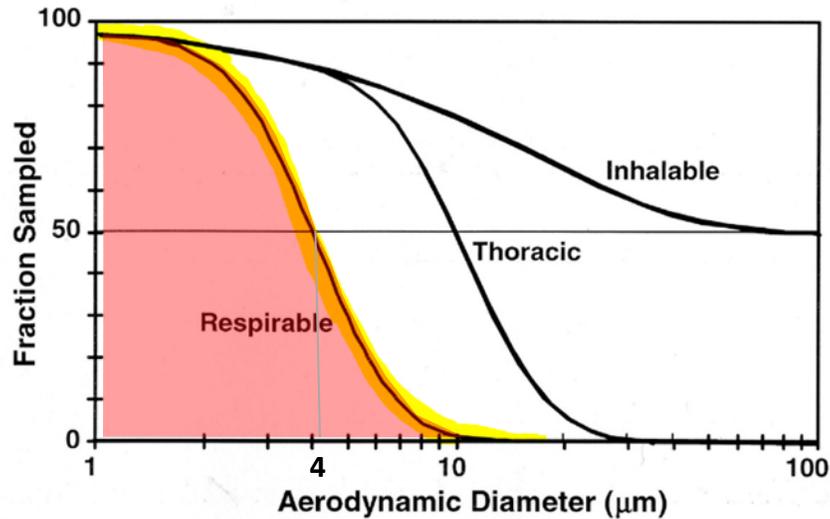

## Funding:

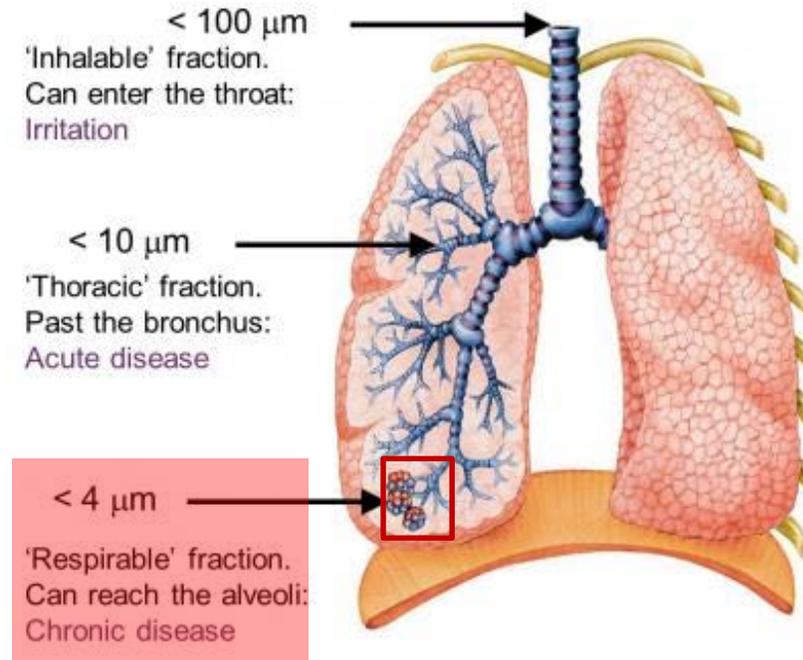

# Respirable Dust Fraction (ISO) - coal/silica dust

ACGIH/ISO sampling criteria for inhalable, thoracic, and respirable fraction

American Conference of Governmental Industrial Hygienists (ACGIH)

## 30 CFR Sub. B

- 1.5 mg/m<sup>3</sup> – underground and surface coal mines
- 0.5 mg/m<sup>3</sup> – air-intakes and part 90 miners
  - LOD → 100 µg/m<sup>3</sup>
- 0.1 mg/m<sup>3</sup> – quartz, or 10%
  - LOD → 20 µg/m<sup>3</sup>

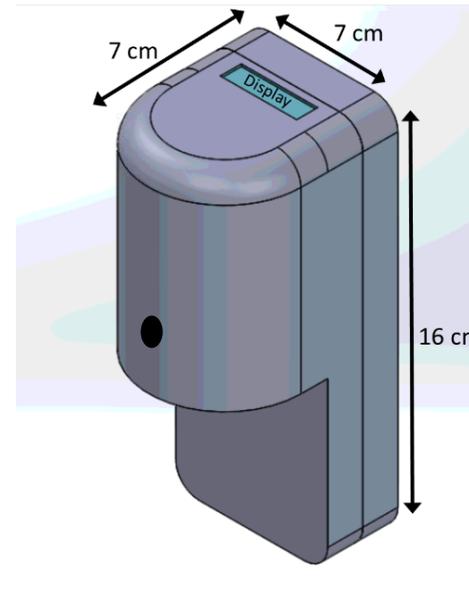

# WEARDM (Wearable Respirable Dust Monitor)

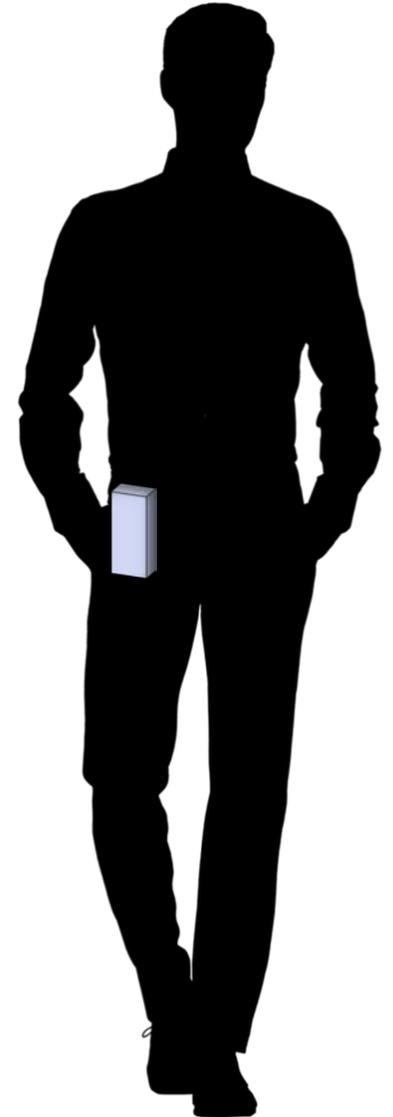

In development at Air-Microfluidics Group, University of Illinois at Chicago.

Technical specs:

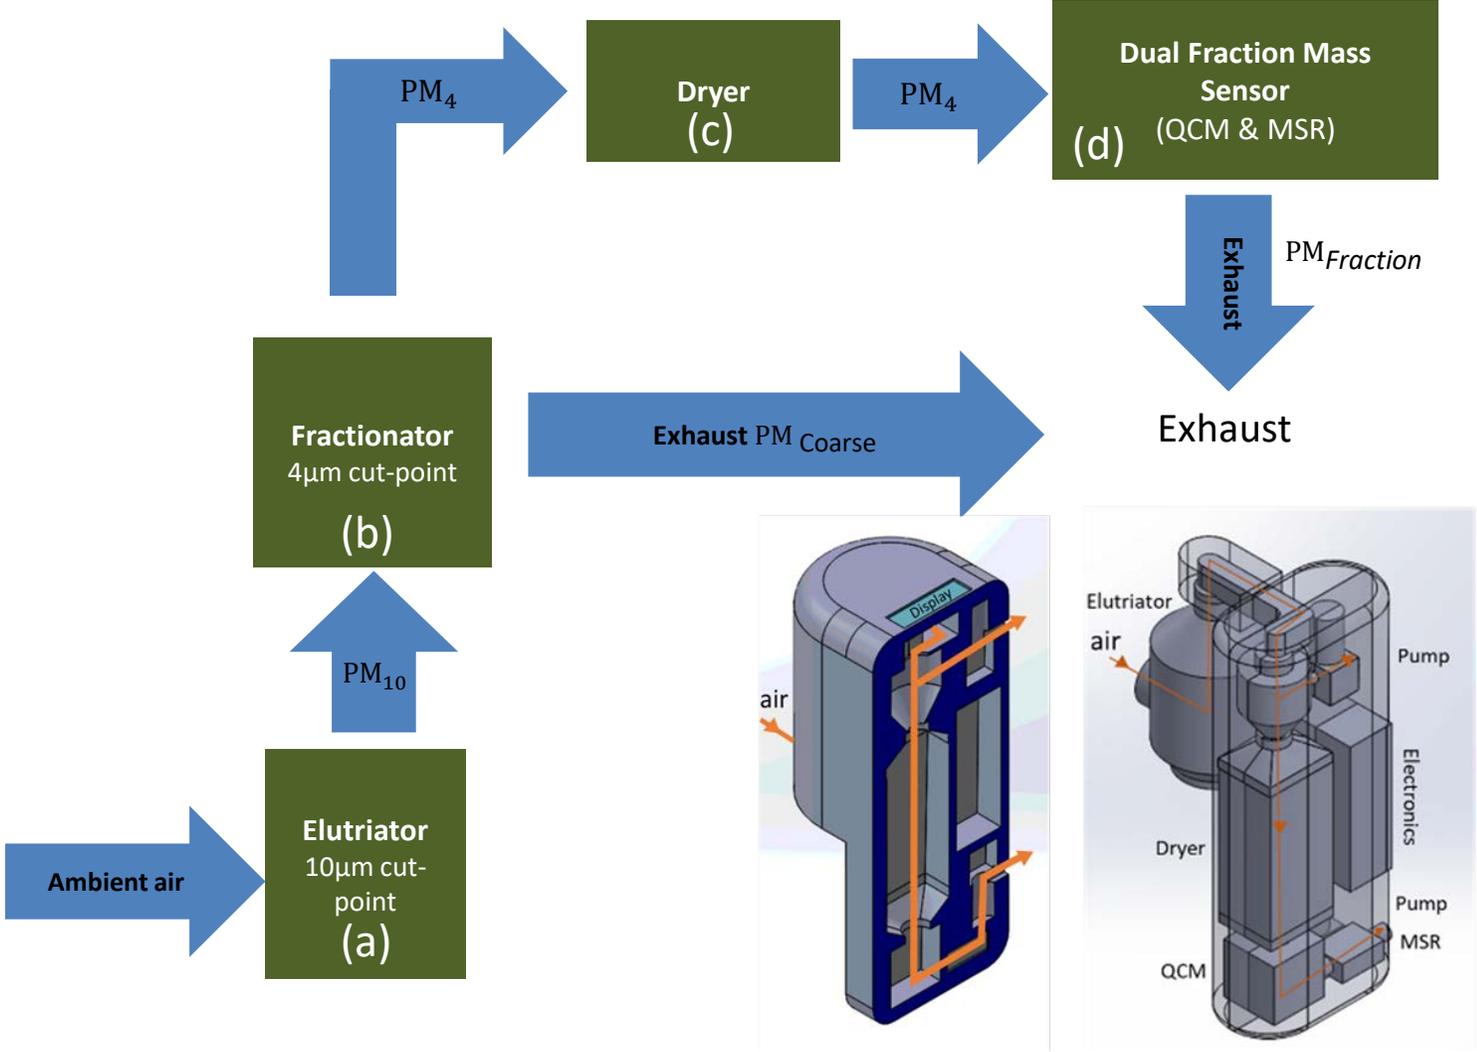

- Large dynamic range ( $30 \mu\text{g}/\text{m}^3$ –  $10 \text{mg}/\text{m}^3$ )
- Real-time (< 30 min integration at LOD)
- Small
- Low cost (< \$1000.00)
- Respirable fraction ( $4.0 \mu\text{m}$  50% cut-point following ISO respirable convention)
- Battery life (250 ml/min flow rate)
- MSHA permissible

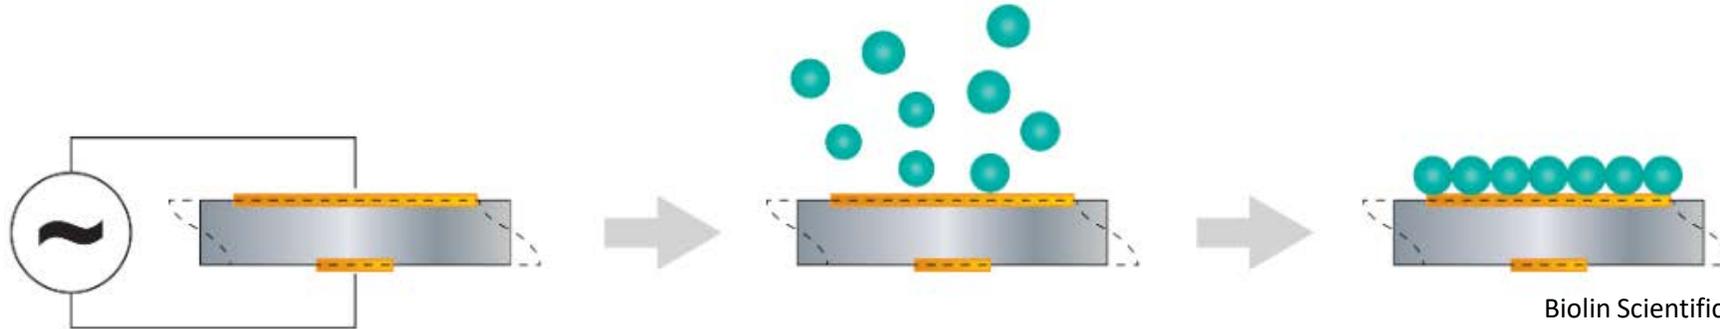

NIOSH #200-2016-91153

# WEARDM (Wearable Respirable Dust Monitor)

# Detection principles : Mass-Sensing Resonator (MSR)

$$\text{Concentration}(\text{mg} \cdot \text{m}^{-3}) = \frac{\Delta m (\text{mg})}{\text{Flow rate}(\text{m}^3 \cdot \text{s}^{-1}) \times \text{time}(\text{s})}$$

Sauerbrey equation:

$$\Delta m = \frac{\Delta f \cdot A \sqrt{\mu_q \rho_q}}{2f_0^2}$$

$\Delta f$  : frequency change

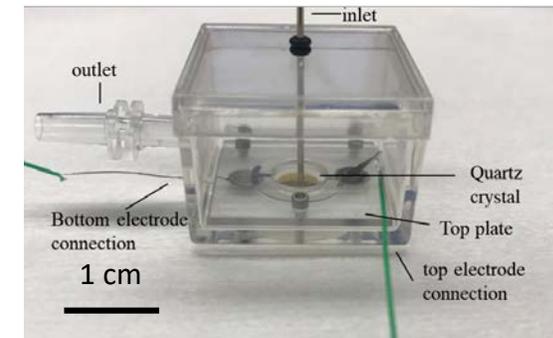

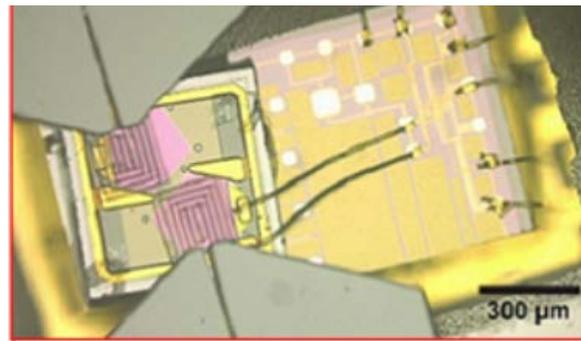

A : active sensing area of the crystal

$\rho_q$  : quartz density

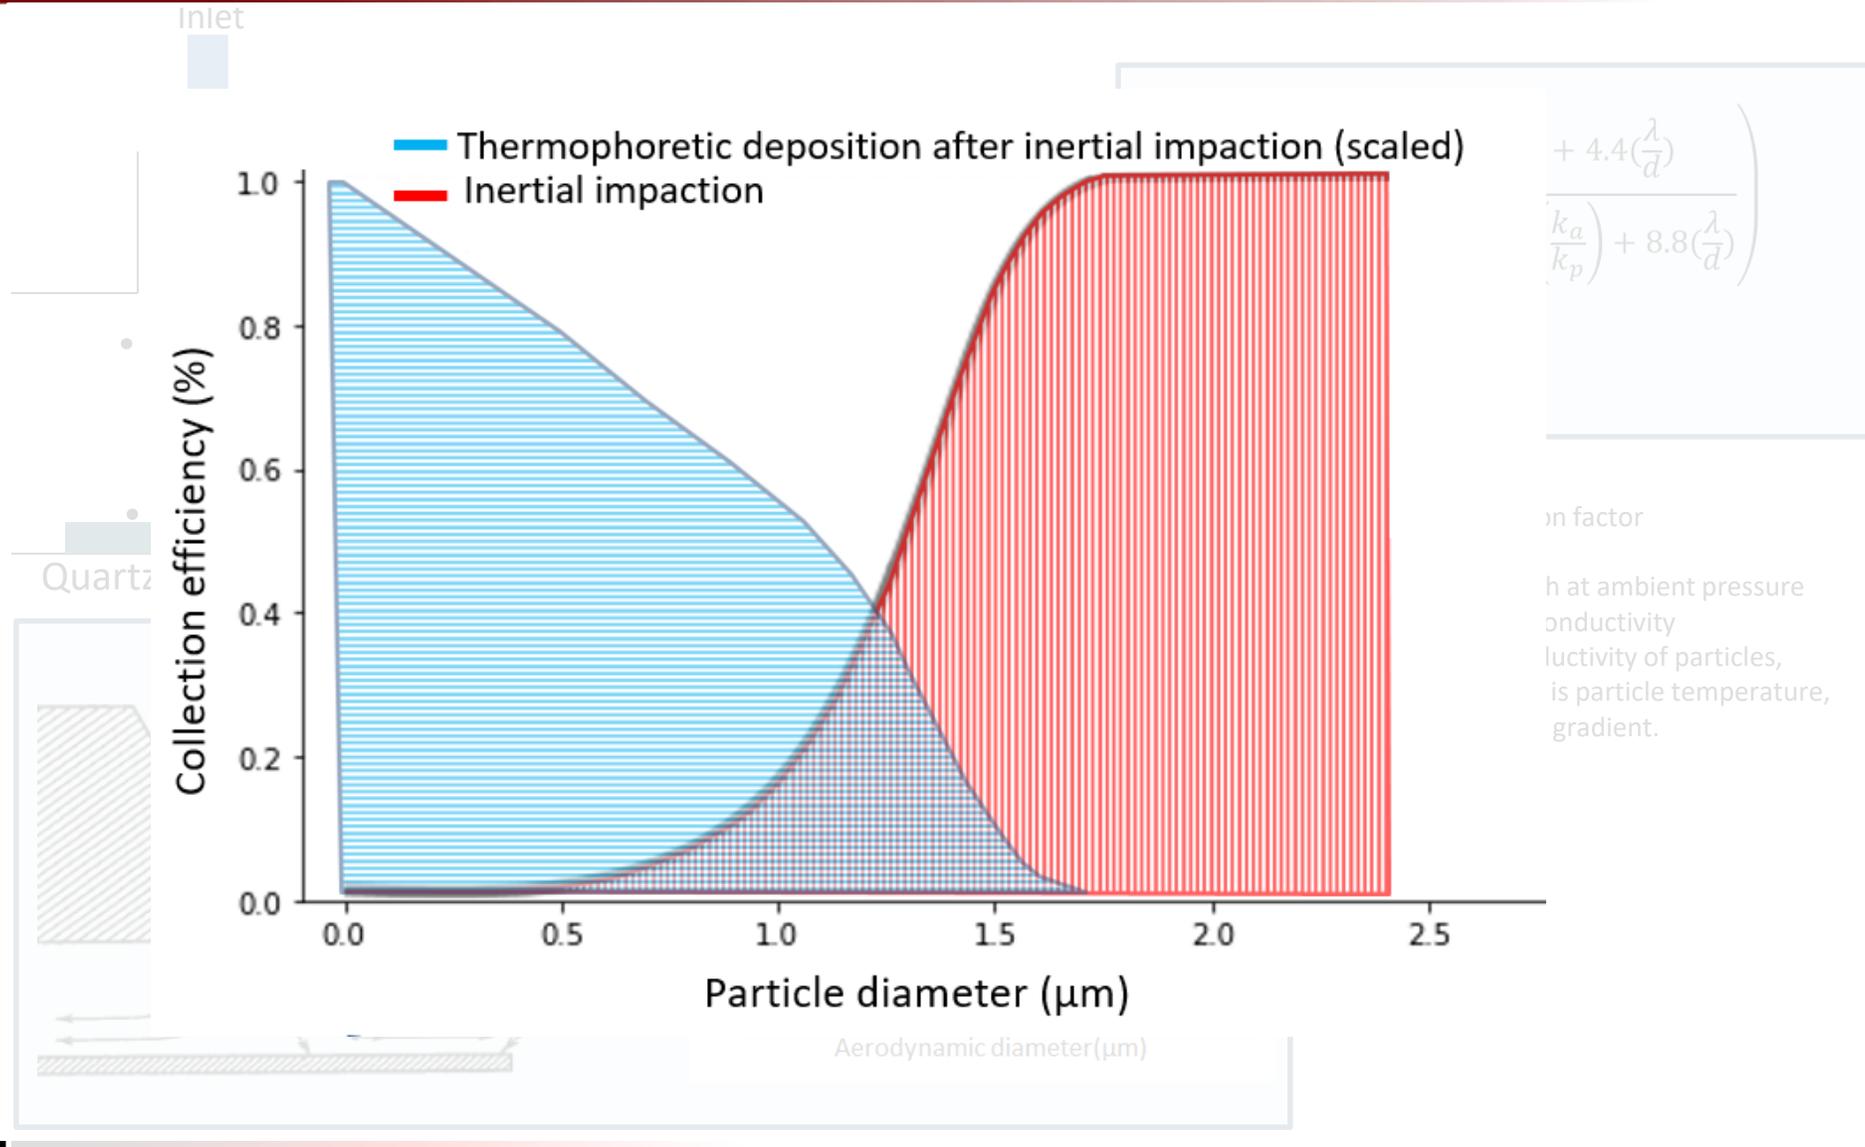

$\mu_q$  : shear modulus of quartz for AT-cut crystal

$f_0$  : resonant frequency of the quartz crystal

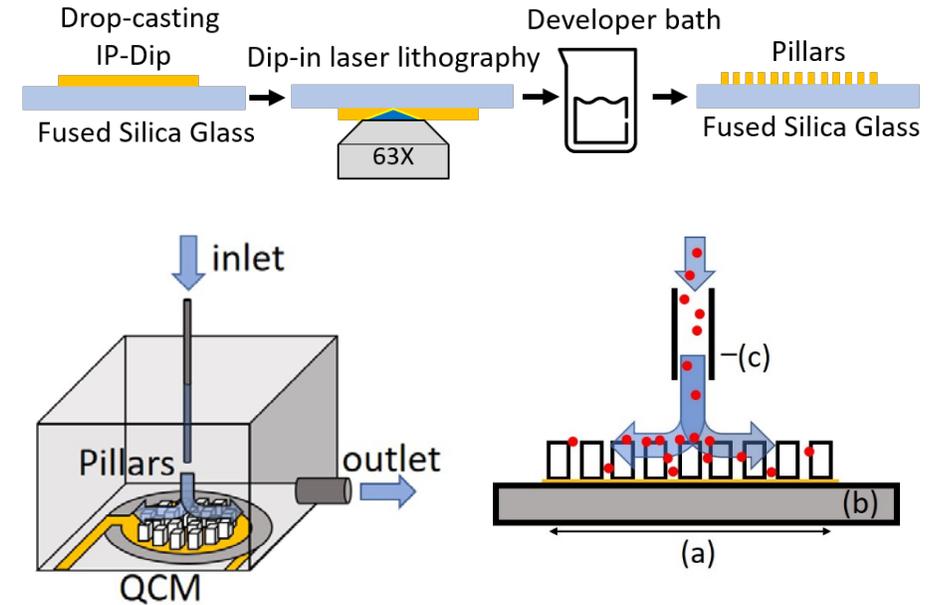

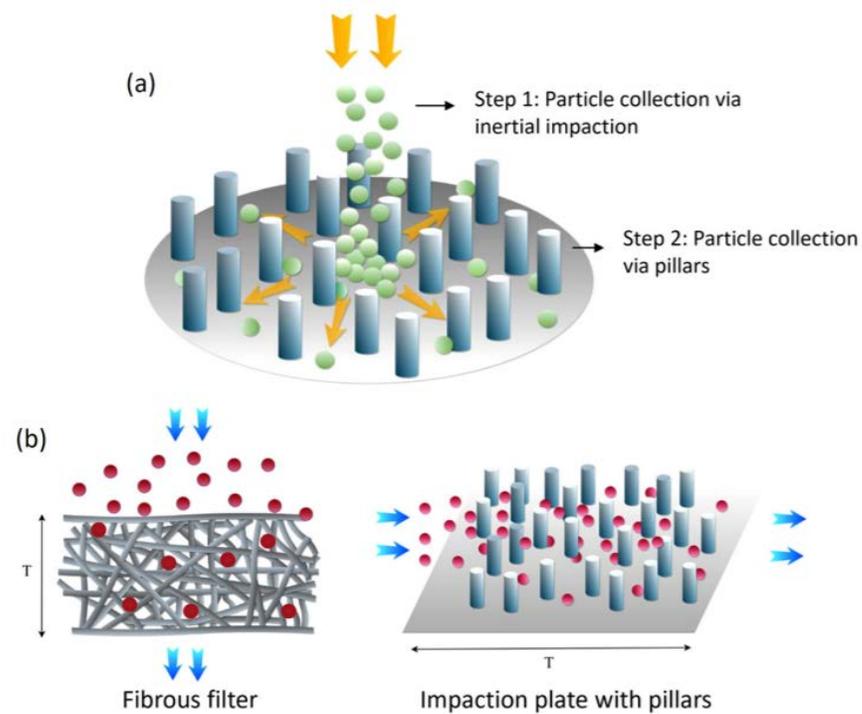

$\Delta m$  : mass added to the crystal's surface.

# Dual Resonator Mass Sensor (DRMS)

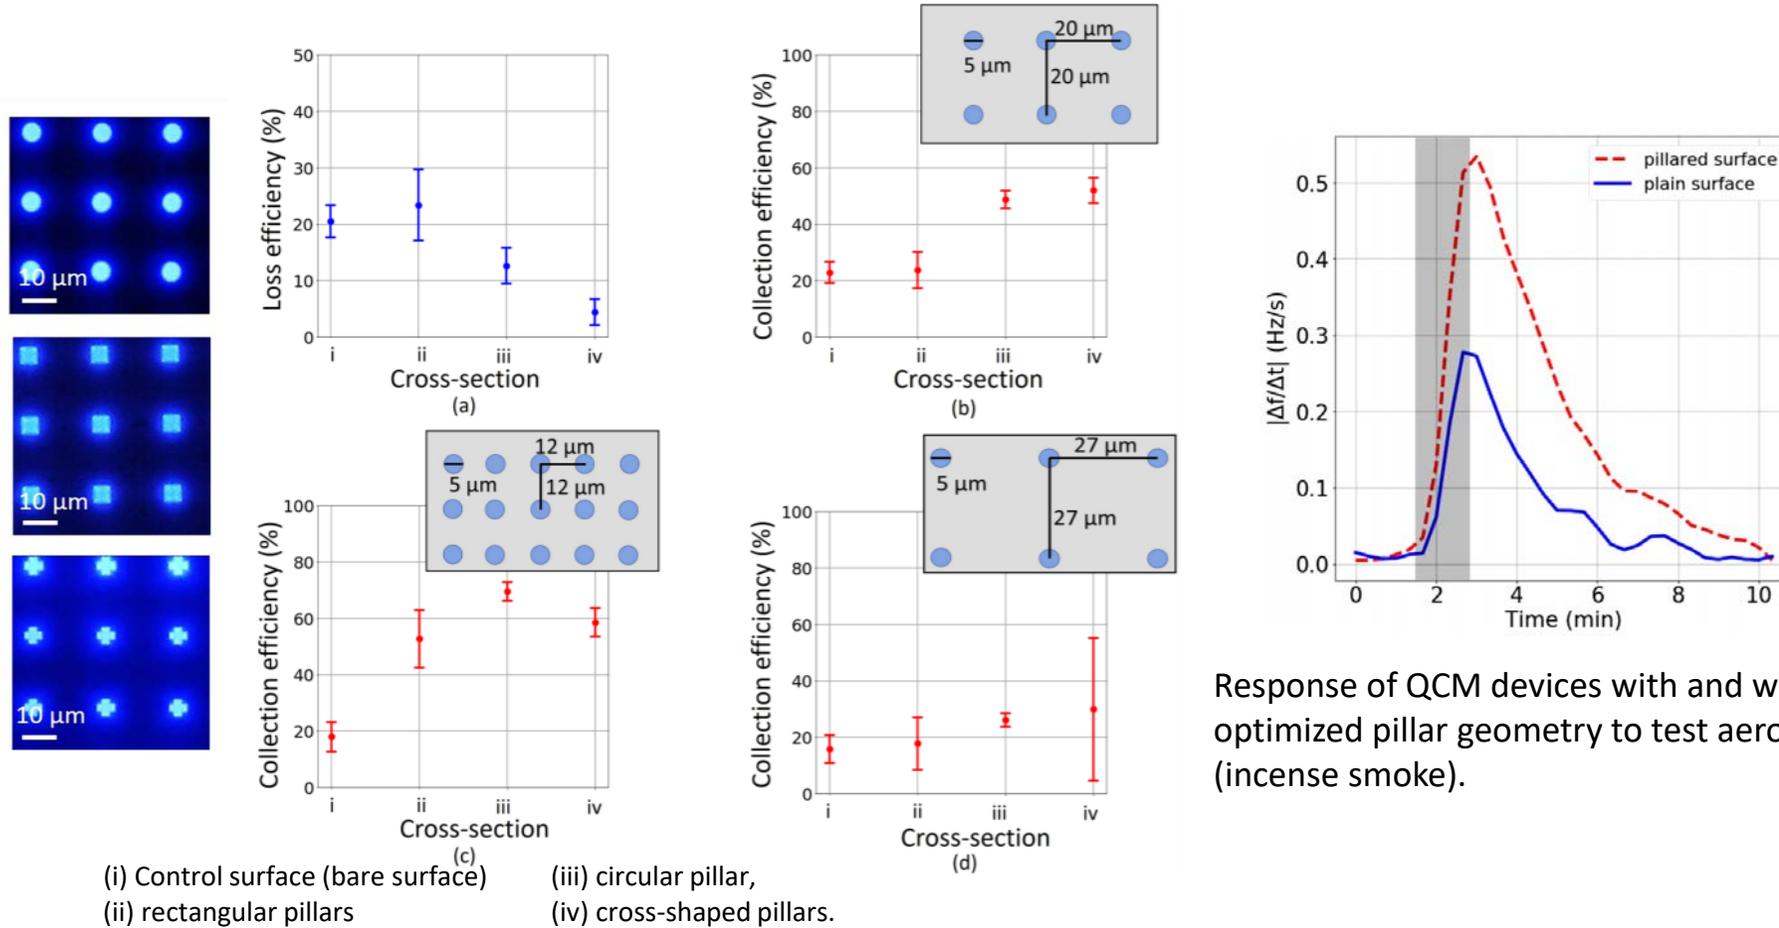

# Surface-modification of the MSR: enhanced- inertial impaction

Similarity between the particle capture mechanism of fibrous filter and the pillar enhanced surface

# Surface-modification of the MSR: Pillar geometry with 2PP

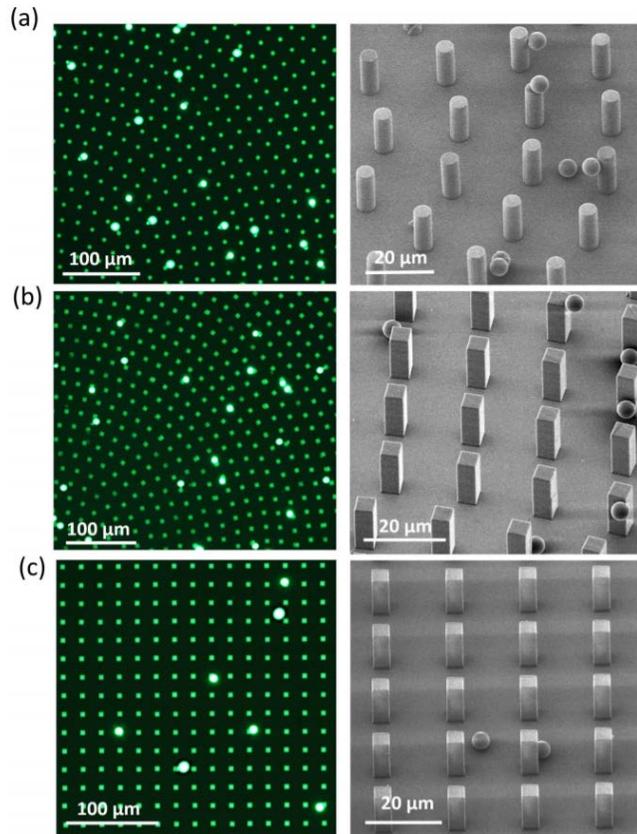

Response of QCM devices with and without optimized pillar geometry to test aerosols (incense smoke).

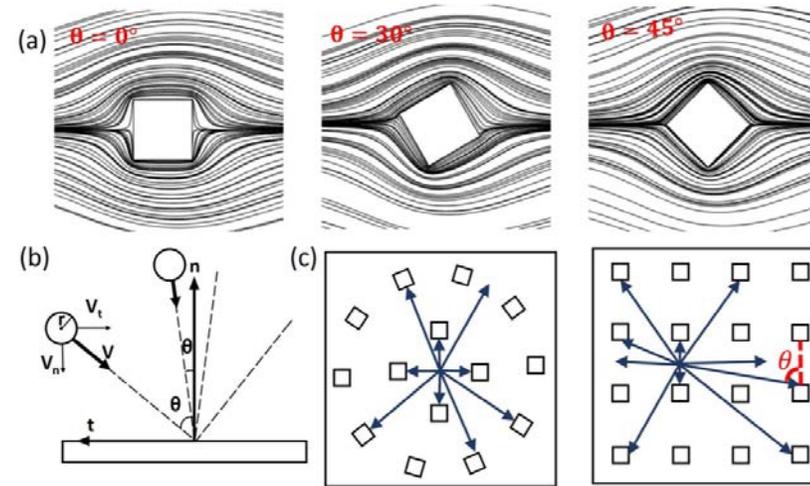

M. Hajizadehmotlagh, I. Paprotny, "Effect of micropillars with varying geometry and density on the efficiency of impaction-based quartz crystal microbalance aerosol sensors", *J. Appl. Phys.* 127, 184903 (2020)

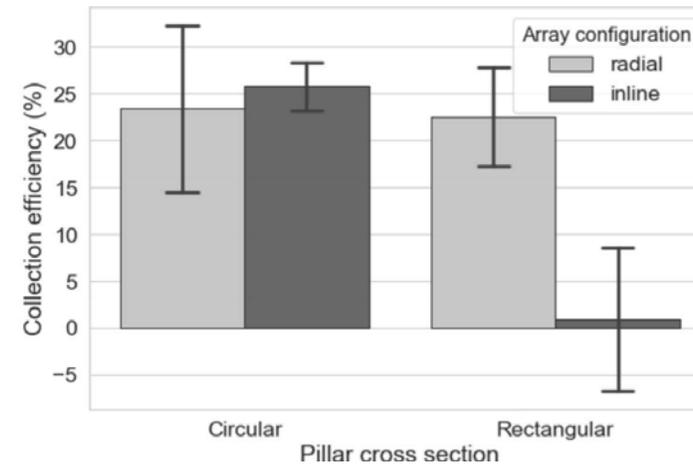

# Surface-modification of the MSR: Pillar distribution

- (a) radially staggered array of circular pillars.
- (b) radially staggered array of rectangular pillars.
- (c) in-line array of rectangular pillars.

(a) Flow field around rectangular fibers. (b) Tangential and normal components of the particle velocity in oblique impaction

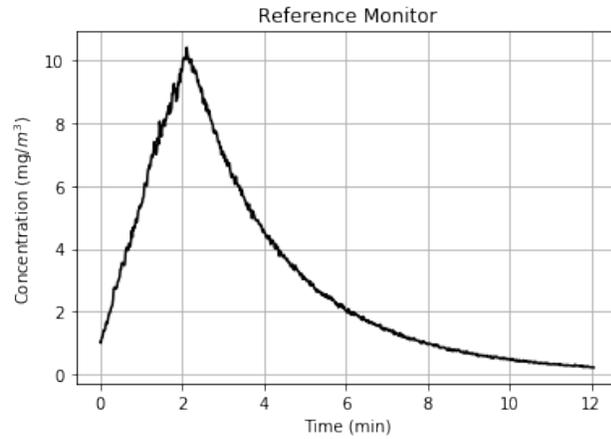

M. Hajizadehmotlagh, A. Singhal, I. Paprotny, "Enhanced Capture of Aerosol Particles on Resonator-Based PM Mass Sensors Using Staggered Arrays of Micro-Pillars", *JMEMS*, 2020.

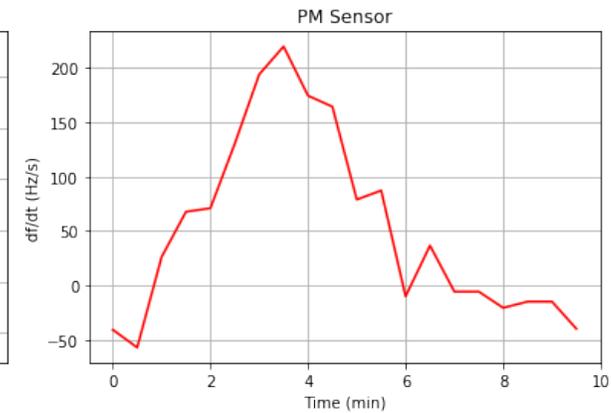

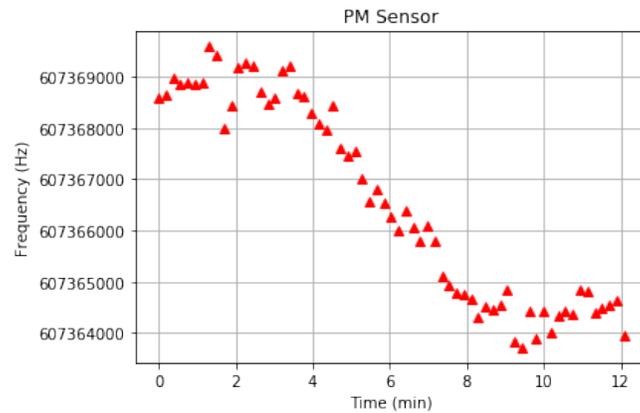

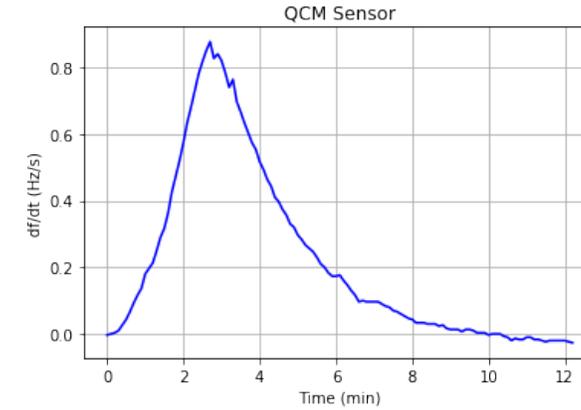

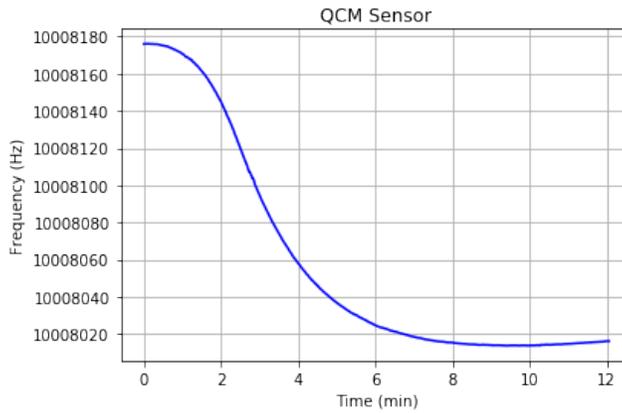

# Initial Results

## Test aerosol (incense)

Reference monitor  
(Kanomax 3442)

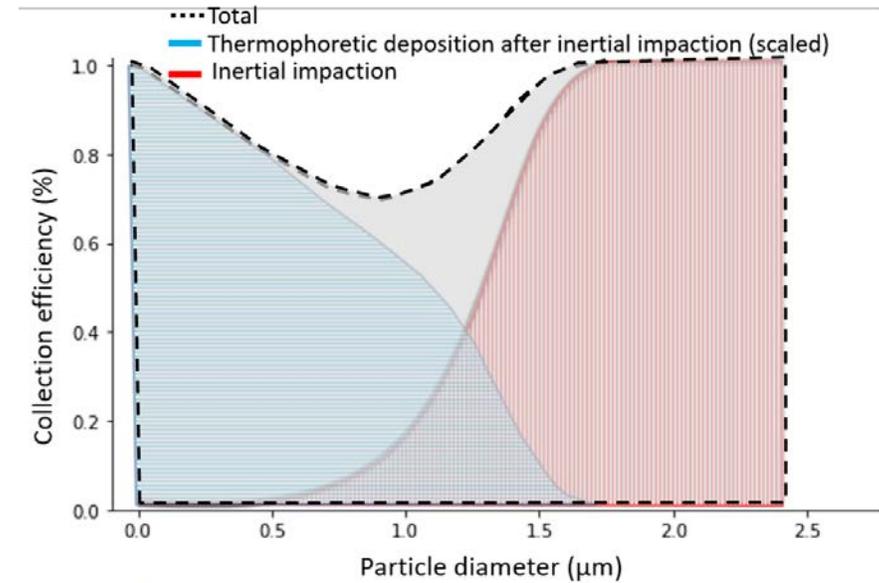

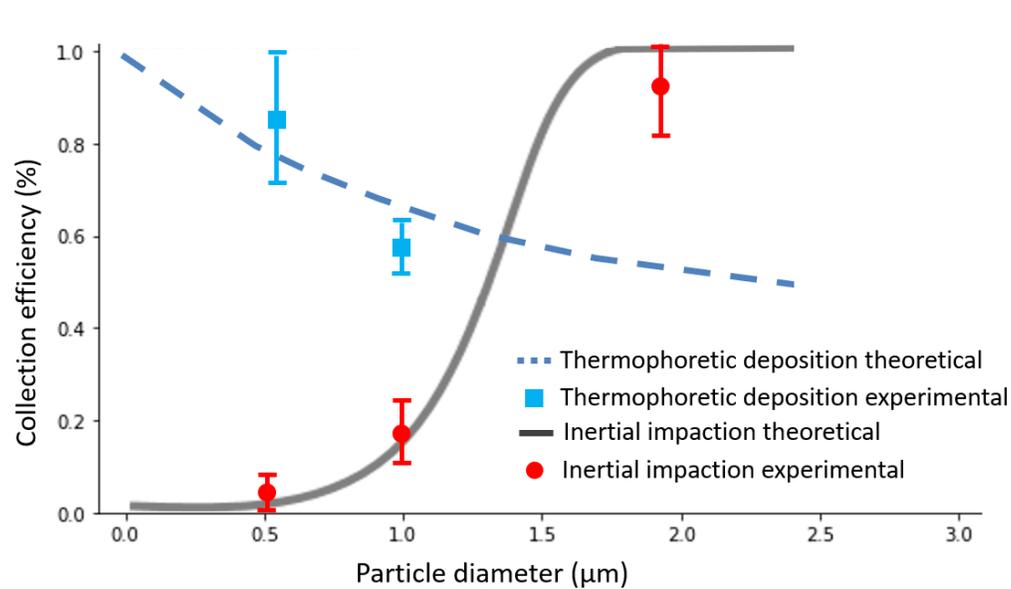

M. Hajzadehmotlagh, et al., *SNA A*, in preparation.

# Initial Results

Cut-point test results with PSL particles.

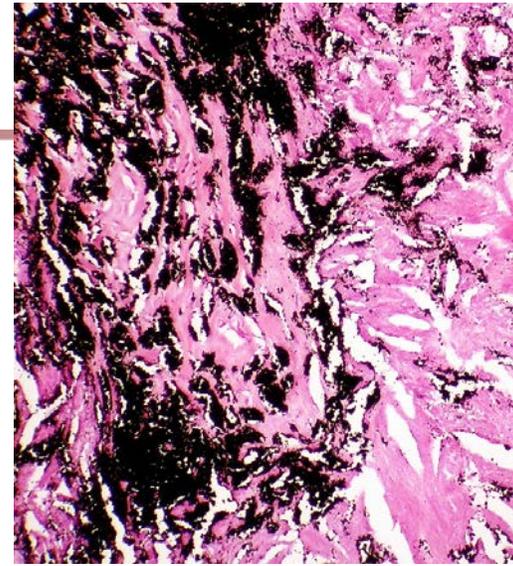

M. Hajizadehmotlagh, et al., *SNA A*, in preparation.

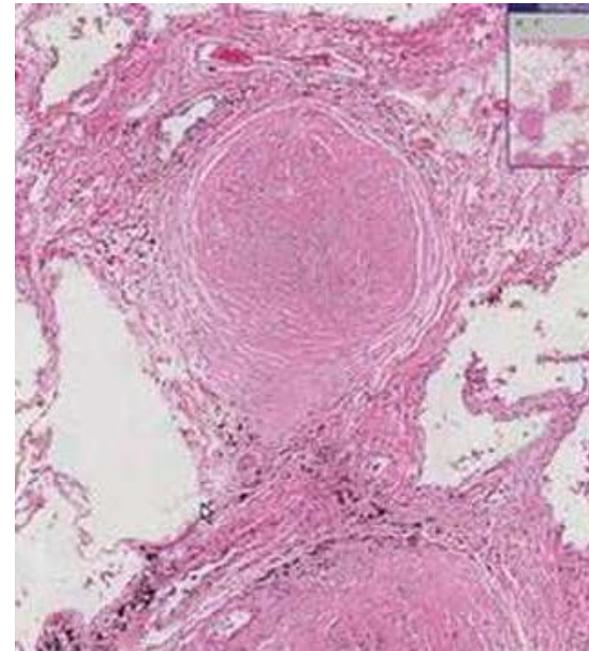

# Histopathology

Coal macule.

Silicotic nodule.

# Silica Speciation

- Beer-Lambert Law

Measure of absorbance      transmittance

$$A = -\log T = \log \frac{I_0}{I}$$

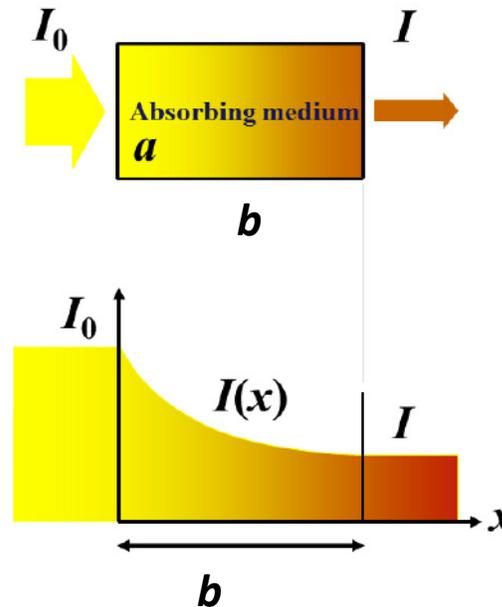

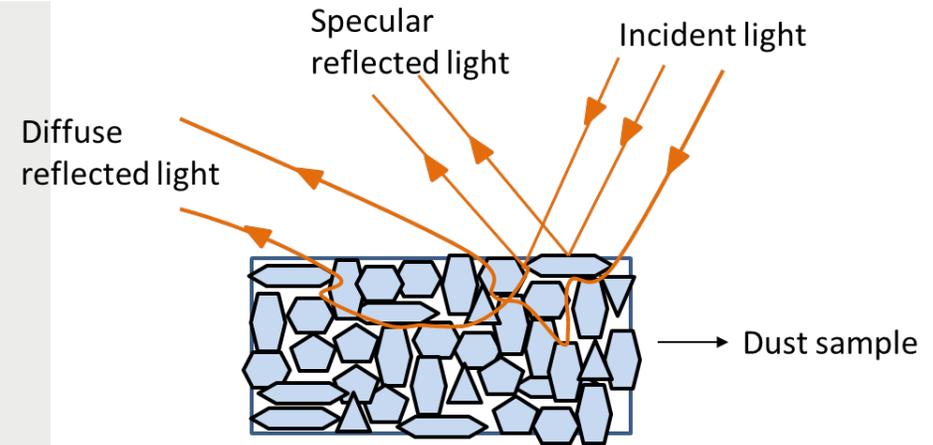

$I$  → Final light intensity  
 $I_0$  → initial light intensity

Absorptivity      Path length

$$A = a(\lambda) b C$$

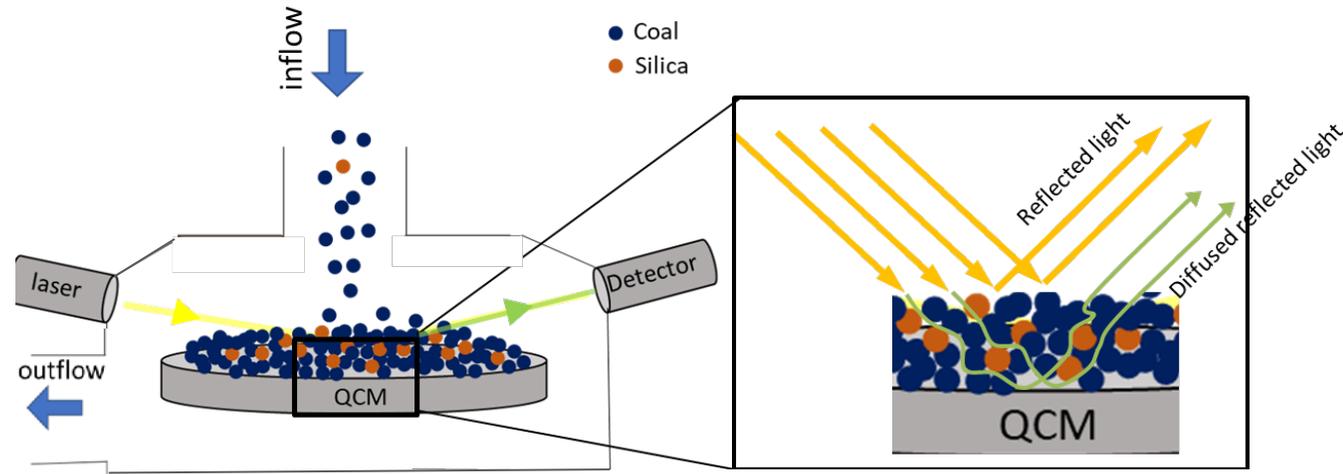

$a(\lambda)$  → Absorptivity  
 $b$  → Path length  
 $C$  → Concentration

$$A_{total} = \sum_i a_i(\lambda) b C_i$$

# Silica Speciation - Optical/Mass Sensor

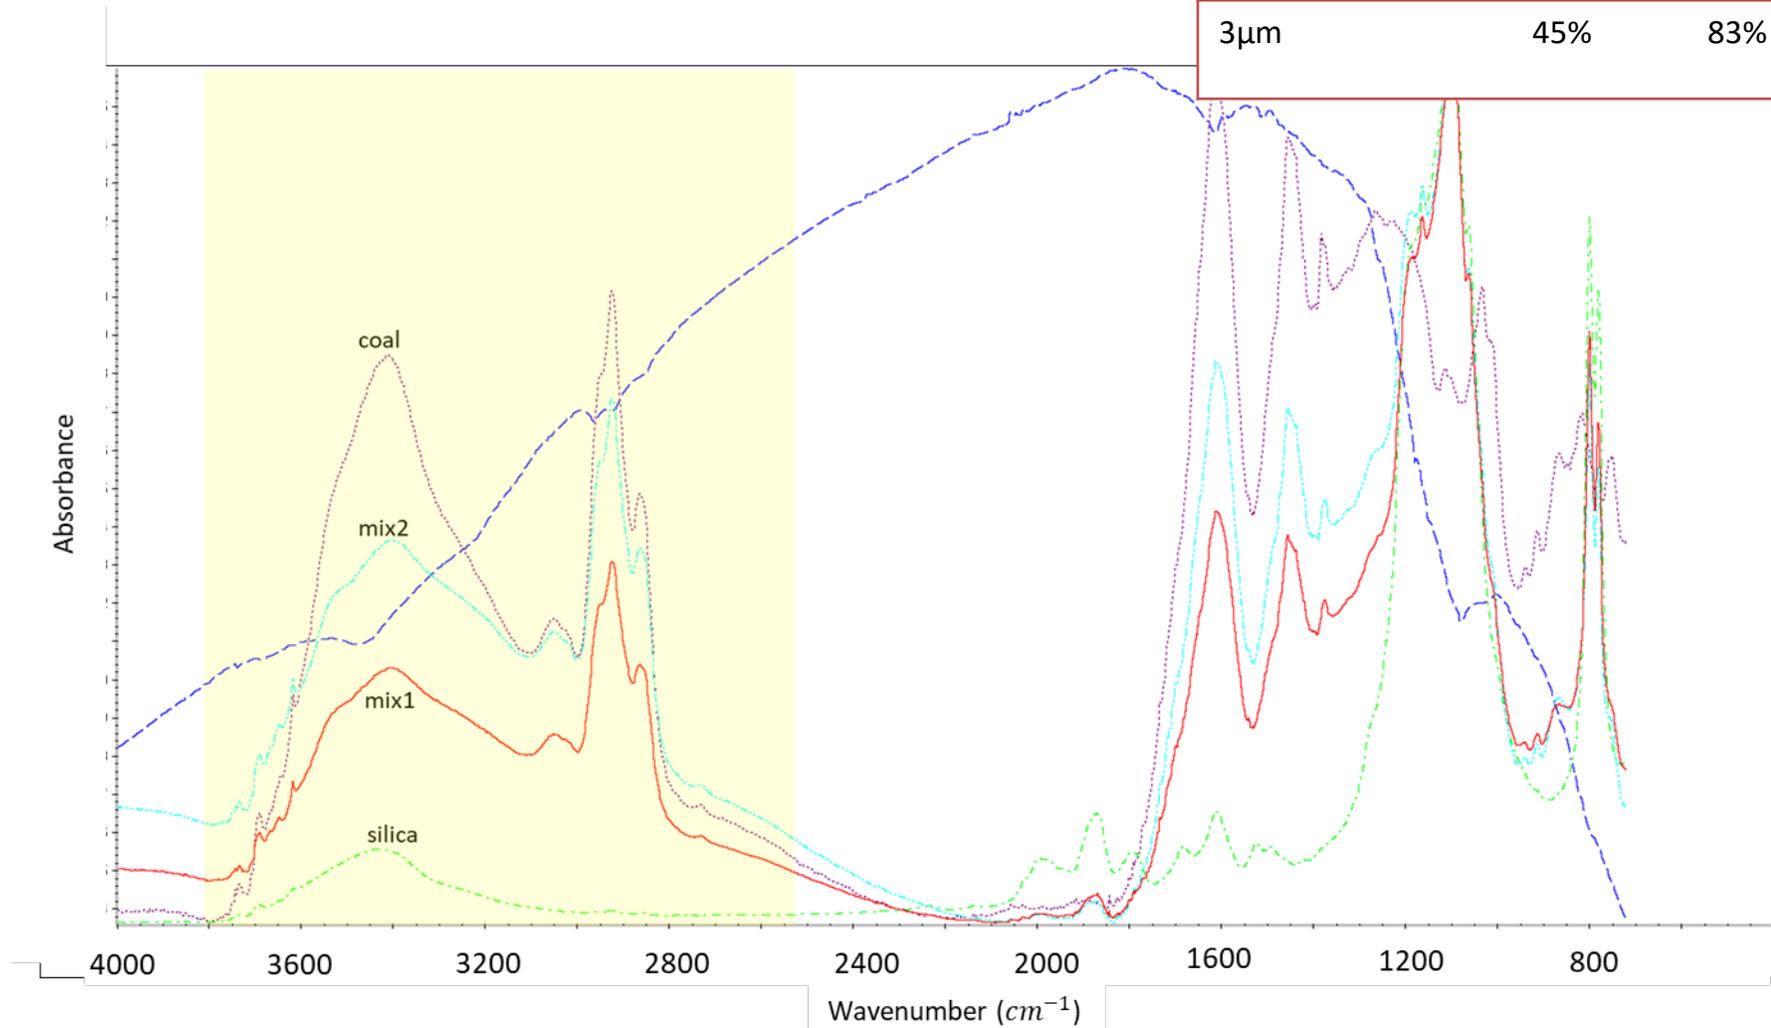

- Optical sensor is based on diffuse reflectance spectroscopy and beer-Lambert law.

Optical sensor	{	$(2) \quad a_{Si}(\lambda) b C_{Si} + a_{Co}(\lambda) b C_{Co} + a_b(\lambda) b C_b = \log \frac{I}{I_0}$ $(3) \quad a_{Si}(\lambda') b C_{Si} + a_{Co}(\lambda') b C_{Co} + a_b(\lambda') b C_b = \log \frac{I'}{I'_0}$	<div style="font-size: 2em;">➔</div> $C_{Si}, C_{Co}, C_b$
Mass sensor	←	$(1) \quad \rho_{Si} C_{Si} + \rho_{Co} C_{Co} + \rho_b C_b = M_{QCM}$	

# FTIR Results

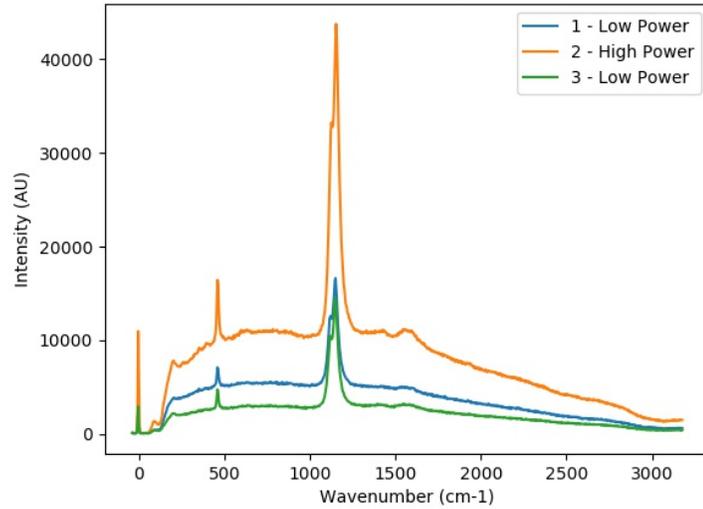

Wavelength	Coal	Silica
2.5 $\mu\text{m}$	70%	81%
3 $\mu\text{m}$	45%	83%

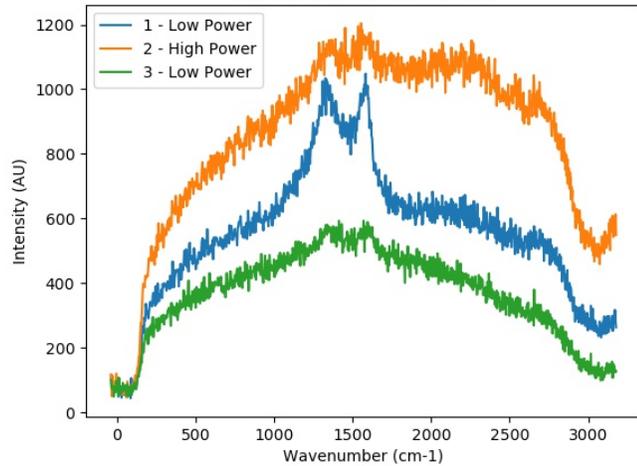

Mix1 - 1:3 silica to coal    Mix2 - 1:4 silica to coal

# RAMAN spectroscopy

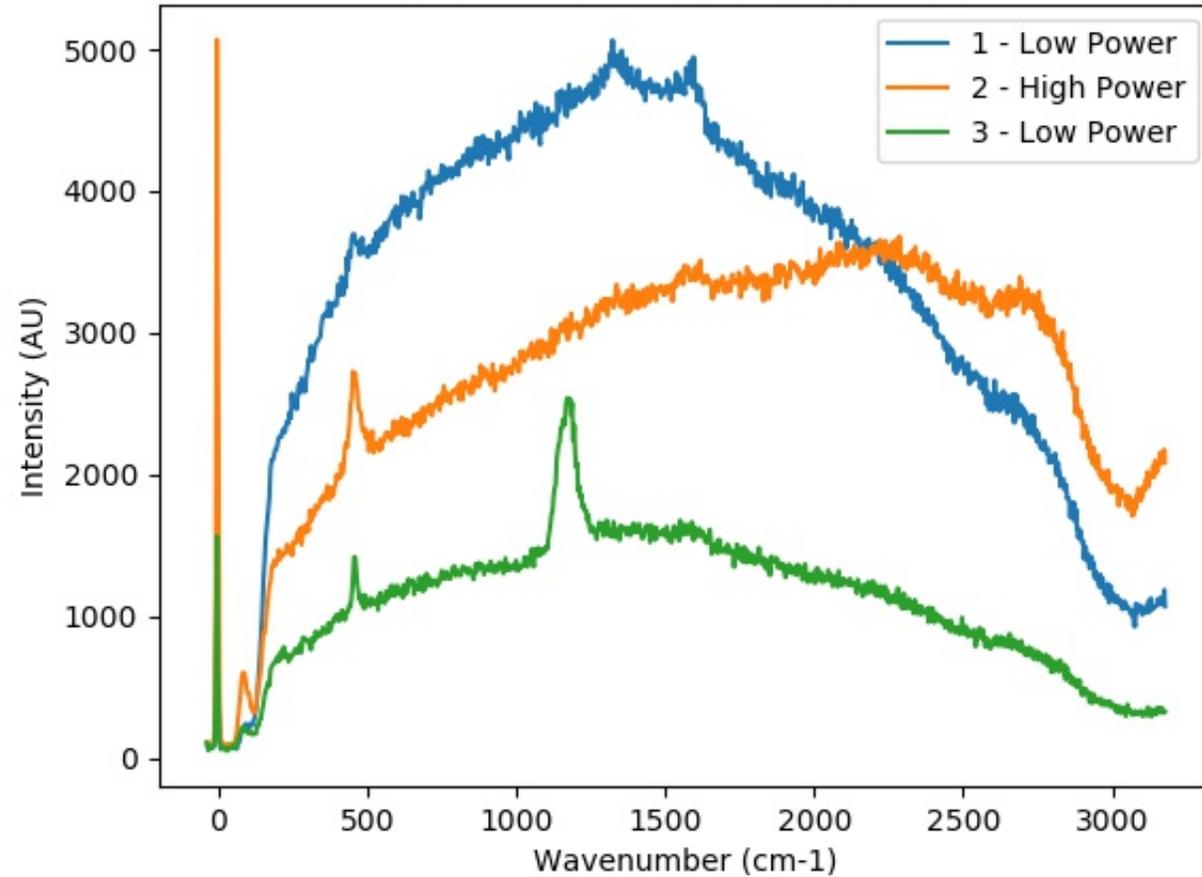

Bulk silica Sample: Location 0

Bulk coal Sample: Location 1

Bulk 1:1 silica/coal Sample: Location 0

# Shortcomings of optical methods w. WEARDM

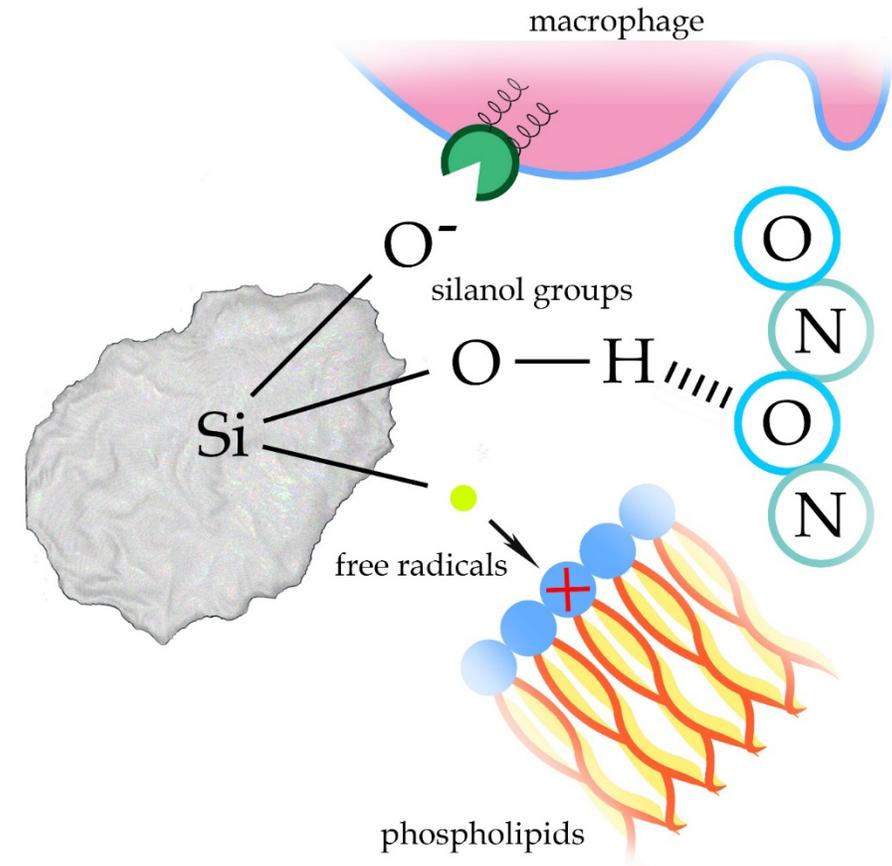

---

- **WEARDM sampling at 250 mL/min**
  - Low signal-to-noise at silica LOD
  - Long integration time
- **Confounding signal**
  - Water peak at 2900 nm
  - Kaolin
  - Silica vs. silicates

**Liquid microfluidic platform -> chemical detection of cellular toxicity**

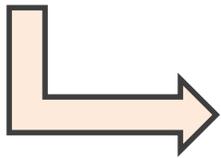

# Silica-inducing cellular damage

- **Silanol groups**
  - Activation of macrophages producing reactive oxygen species
  - Disruption of biological membranes
- **Free radicals**
  - Lipid peroxidation
  - DNA damage

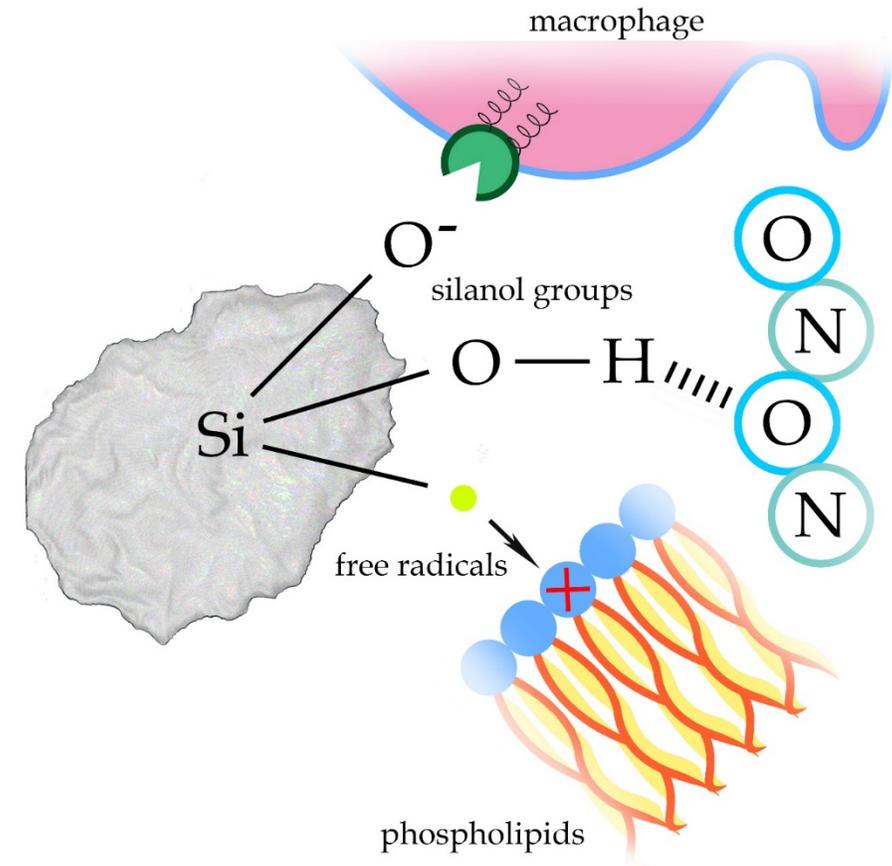

# Silica-inducing cellular damage

# Seamless transport : digital microfluidics

No voltage - No droplet movement

Droplet movement driven by voltage

$$R_0 = -\frac{d}{2 \cos \theta_0}$$

$$R_d = -\frac{d}{\cos \theta_0 + \cos \theta_d}$$

We found:

$$\Delta P = \gamma \frac{\cos \theta_d - \cos \theta_0}{d}$$

Design features that improve pumping

Superhydrophobic surfaces

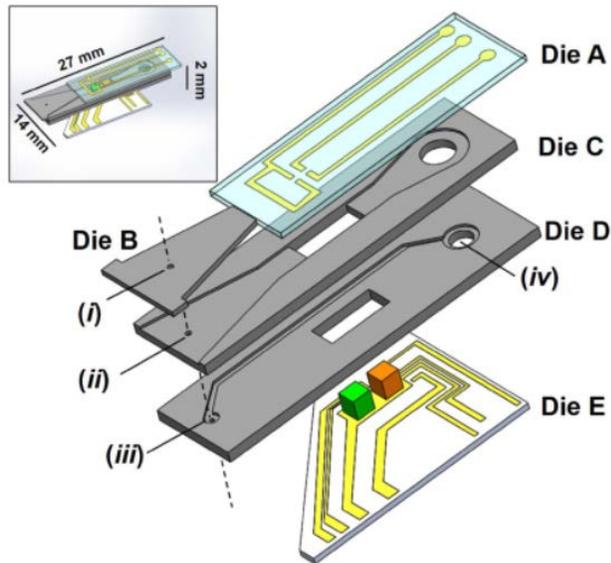

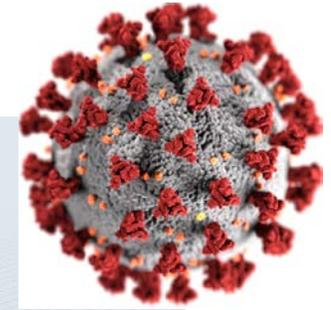

Dielectric thickness

Height of top plate

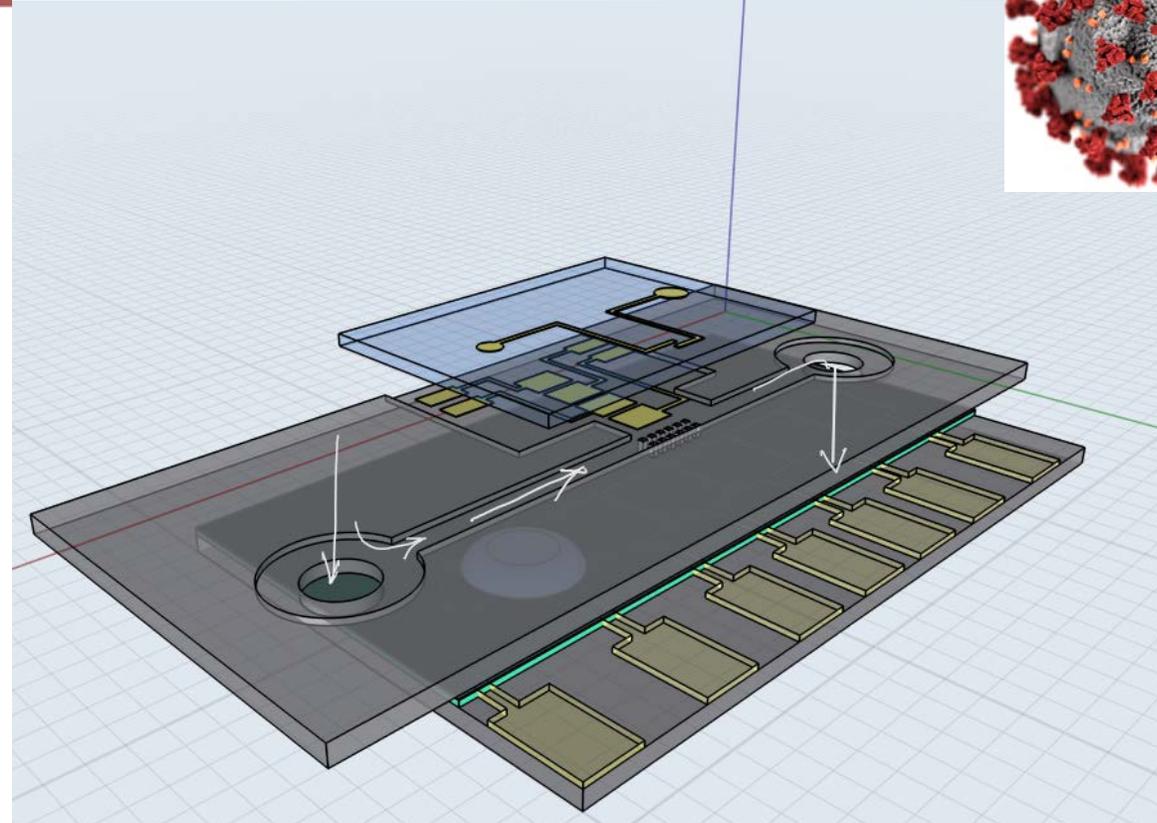

Material properties/conc. of solution

# Bio-Aerosol Detector (Concept drawing)

Legacy PM2.5 sensor design

Adaptation of PM 2.5 design for EWOD pumping based aerosol sampler;

Fahimi, Dorsa, et al. "Vertically-stacked MEMS pm2.5 sensor for wearable applications." *Sensors and Actuators A: Physical* 299 (2019): 111569.

# Conclusion

---

- Difficult to detect silica in real-time (< 30 min integration time) with a wearable footprint using air microfluidics and opto-gravimetric methods
- Established methods exists to detect cellular damaging silica dust in laboratory settings
- Hybrid microfluidic platforms allow for enhanced concentration and chemical detection using legacy methods
- Can be made very low cost:
  - Small footprint
  - Inexpensive materials (i.e. paper)
